Problem:

We need a program that acts as a manager; that can perform actions such as showing the dresses in stock, add new dresses, be able to edit the information of the entered dresses, delete a dress and that manages to generate a readable report with the input data.

Overview:

Small stores are beginning to implement the use of administrative software to have better data management and automate processes that were done manually not long ago.

Store managers look for solidity and confidence in the software that will be applied in store management.

Background:

The basic administrative actions of the store are essential for good management, whether it is for customer-seller communication issues or to keep clear accounting, which are the pillars of any company.

The application of the administration extends to all branches of the company, the operational, executive, and managerial part, each branch has different functions, however, they all converge on a single ideal, to keep the company afloat.

Apartment Comparison:

The different departments of the company constitute the bases of the store, however the administration and management processes in each one of them are different, but based on the analysis of the case, the **operational part of the store** has more focus on the program of this project.
